**Progress in Cell Cycle Research** Laurent Meijer, Armelle Jézéquel, Bernard Ducommun, 2012-12-06 The Progress in Cell Cycle Research series is dedicated to serve as a collection of reviews on various aspects of the cell division cycle with special emphasis on less studied aspects We hope this series will continue to be helpful to students graduates and researchers interested in the cell cycle area and related fields We hope that reading of these chapters will constitute a point of entry into specific aspects of this vast and fast moving field of research As PCCR4 is being printed several other books on the cell cycle have appeared ref 1 3 which should complement our series This fourth volume of PCCR starts with a review on RAS pathways and how they impinge on the cell cycle chapter 1 In chapter 2 an overview is presented on the links between cell anchorage cytoskeleton and cell cycle progression A model of the G1 control in mammalian cells is provided in chapter 3 The role of histone acetylation and cell cycle control is described in chapter 4 Then follow a few reviews dedicated to specific cell cycle regulators the 14 3 3 protein chapter 5 the cdc7 Dbf4 protein kinase chapter 6 the two products of the p16 CDKN2A locus and their link with Rb and p53 chapter 7 the Ph085 cyclin dependent kinases in yeast chapter 9 the cdc25 phosphatase chapter 10 RCC1 and ran chapter 13 The intriguing phosphorylation dependent prolyl isomerization process and its function in cell cycle regulation are reviewed in chapter 8

**Progress in Cell Cycle Research** Laurent Meijer, Silvana Guidet, Michel Philippe, 2012-12-06 The Progress in Cell Cycle Research series has been conceived to serve as a collection of reviews on various aspects of a fast growing biology field the cell division cycle These reviews do not pretend to cover all aspects of cell cycle regulation and mechanisms but rather focus on a few topics of particular interest in the recent literature This third volume starts with a broad overview of the diversity of ways by which viruses subdue their host cell cycle chapter 1 Of particular interest in this area is the case of HN which has recently been extensively investigated chapter 2 Although most of our understanding of cell cycle regulation derives from work performed in yeast and animal cells plant models reviewed in chapter 3 for one of the best studied example Arabidopsis are starting to contribute significantly to the cell cycle general picture In mammals the regulation of cell division of two types of tissues the intestine chapter 4 and the developing muscle chapter 5 are investigated in an interesting physiological context Cell division is accompanied by a number of morphological changes One of them organelle transport is starting to be better understood chapter 6 The next few chapter summarise our knowledge of some essential regulators of the cell cycle A still intriguing enzyme casein kinase 2 is reviewed in detail in chapter 7 Some of the most studied cell cycle regulators are certainly the CKI s cyclin dependent kinases inhibitors chapter 8

**Progress in Cell Cycle Research** S. Guidet, S.V. Meijerink, H.Y.L. Tung, 2012-12-06 Progress in Cell Cycle Research is a new annual series designed to be the source for up to date research on this rapidly expanding field Review articles by international experts examine various aspects of cell division regulation from fundamental

perspectives to potential medical applications Researchers as well as advanced undergraduate and graduate students in cell biology biochemistry and molecular biology will benefit from this series

**Progress in Cell Cycle Research** Laurent Meijer, Silvana Guidet, Lee Vogel, 1996-11-30 Now in its second year Progress in Cell Cycle Research was conceived to serve as an up to date introduction to various aspects of the cell division cycle Although an annual review in any field of scientific investigation can never be as current as desired especially in the cell cycle field we hope that this volume will be helpful to students to recent graduates considering a deliitation in subject and to investigators at the fringe of the cell cycle field wishing to bridge frontiers An instructive approach to many subjects in biology is often to make comparisons between evolutionary distant organisms If one is willing to accept that yeast represent a model primitive eukaryote then it is possible to make some interesting comparisons of cell cycle control mechanisms between mammals and our little unicellular cousins By and large unicellular organisms have no need for intracellular communication With the exception of the mating phenomenon in *S cerevisiae* and perhaps some nutritional sensing mechanisms cellular division of yeast proceeds with complete disregard for neighbourly communication Multicellular organisms on the other hand depend entirely on intracellular communication to maintain structural integrity Consequently elaborate networks have evolved to either prevent or promote appropriate cell division in multicellular organisms Yet as described in chapter two the rudimentary mechanisms for fine tuning the cell division cycle in higher eukaryotes are already apparent in yeast
