

## SECTION 3.3

# Projectile Motion

## Two-Dimensional Motion

Suppose you toss a ball to a friend standing 4 meters away. Its path is an arc through the air. The vector of displacement of the ball is forward. The initial velocity vector is up and forward. The acceleration vector is downward.

**Use of components avoids vector multiplication.**

Vectors in different directions can be directly combined. But the math is complicated and outside the scope of this book. We will resolve the motion of a thrown or launched object into horizontal and vertical.

**Components simplify projectile motion.**

A long jumper leaps into the air. Her velocity has a vertical component and a horizontal component. The path followed by an object thrown or launched into the air is called projectile motion. Ignore air resistance for now. The projectile's path will be determined by its initial velocity and the acceleration due to gravity.

**Projectiles follow parabolic trajectories.**

You may have seen fireworks explode. The firework's burning alloys are thrown outward with an initial velocity and fall due to gravity. The path each draws in the sky is a parabola. Different "stars" from a firework trace slightly different parabolas. This is based on the initial angle of velocity for each star.

**Projectile motion is free fall with an initial horizontal velocity.**

Suppose you roll a ball across a table with a speed of  $v_x$ . The displacement is given by  $d_x = v_x t$ . Now drop the ball. The displacement is given by  $d_y = -\frac{1}{2}gt^2$ . Projectile motion combines these displacements.

## KEY TERM

projectile motion

## Critical Thinking

1. **Describe** Draw a sketch of the path of the ball tossed to your friend.

A long jumper jumps forward ( $v_x$ ) and upward ( $v_y$ ).

## Critical Thinking

2. **Describe** Draw a sketch of an exploding firework.
