Micro Econometrics Methods Of Moments And Limited Dependent Variables:

Micro-Econometrics Myoung-jae Lee, 2009-09-28 When I wrote the book *Methods of Moments and Semiparametric Econometrics for Limited Dependent Variable Models* published from Springer in 1996 my motivation was clear there was no book available to convey the latest messages in micro econometrics The messages were that most econometric estimators can be viewed as method of moment estimators and that inferences for models with limited dependent variables LDV can be done without going fully parametric Time has passed and there are now several books available for the same purpose These days methods of moments are the mainstay in econometrics not just in micro but also in macro econometrics Many papers have been published for semiparametric methods and LDV models I myself learned much over the years since 1996 so much so that my own view on what should be taught and how has changed much Particularly my exposure to the sample selection and treatment effect literature has changed the way I look at econometrics now When I set out to write the second edition of the 1996 book these changes prompted me to re title reorganize and re focus the book *Matching, Regression Discontinuity, Difference in Differences, and Beyond* Myoung-jae Lee, 2016-05-02 This book reviews the three most popular methods and their extensions in applied economics and other social sciences matching regression discontinuity and difference in differences The book introduces the underlying econometric statistical ideas shows what is identified and how the identified parameters are estimated and then illustrates how they are applied with real empirical examples

The Oxford Handbook of Panel Data Badi Hani Baltagi, 2015 The Oxford Handbook of Panel Data examines new developments in the theory and applications of panel data It includes basic topics like non stationary panels cointegration in panels multifactor panel models panel unit roots measurement error in panels incidental parameters and dynamic panels spatial panels nonparametric panel data random coefficients treatment effects sample selection count panel data limited dependent variable panel models unbalanced panel models with interactive effects and influential observations in panel data Contributors to the Handbook explore applications of panel data to a wide range of topics in economics including health labor marketing trade productivity and macro applications in panels This Handbook is an informative and comprehensive guide for both those who are relatively new to the field and for those wishing to extend their knowledge to the frontier It is a trusted and definitive source on panel data having been edited by Professor Badi Baltagi widely recognized as one of the foremost econometricians in the area of panel data econometrics Professor Baltagi has successfully recruited an all star cast of experts for each of the well chosen topics in the Handbook

Missing Data Methods David M. Methods of Moments and Semiparametric Econometrics for Limited Dependent Variable Models Myoung-jae Lee, 2013-04-17 In this book the author surveys new techniques in econometrics which may be used to analyse semiparametric models As well as covering topics such as instrumental variable estimation nonparametric density and regression function estimation and semiparametric limited dependent variable models the book provides details of how these methods may be implemented using software

Methods of Moments and Semiparametric Econometrics for Limited Dependent Variable Models, 2010

Microeconometrics A. Colin Cameron, Pravin K. Trivedi, 2005-05-09 This book provides the most comprehensive treatment to date of microeconometrics the analysis of individual level data on the economic behavior of individuals or firms using regression methods for cross section and panel data The book is oriented to the practitioner A basic understanding of the linear regression model with matrix algebra is assumed The text can be used for a microeconometrics course typically a second year economics PhD course for data oriented applied microeconometrics field courses and as a reference work for graduate students and applied researchers who wish to fill in gaps in their toolkit Distinguishing features of the book include emphasis on nonlinear models and robust inference simulation based estimation and problems of complex survey data The book makes frequent use of numerical examples based on generated data to illustrate the key models and methods More substantially it systematically integrates into the text empirical illustrations based on seven large and exceptionally rich data sets

Econometric Inference Using Simulation Techniques Herman K. van Dijk, Alain Monfort, Bryan W. Brown, 1995-07-11 This book provides a comprehensive assessment of the latest simulation techniques and examines the three main areas of econometric inference where the use of simulation methods has been successful Bayesian inference classical inference and the solution and stochastic simulation of dynamic econometric models in particular general equilibrium models

Measurement Error and Latent Variables in Econometrics T. Wansbeek, E. Meijer, 2000-12-08 The book first discusses in depth various aspects of the well known inconsistency that arises when explanatory variables in a linear regression model are measured with error Despite this inconsistency the region where the true regression coefficients lies can sometimes be characterized in a useful way especially when bounds are known on the measurement error variance but also when such information is absent Wage discrimination with imperfect productivity measurement is discussed as an important special case Next it is shown that the inconsistency is not accidental but fundamental Due to an identification problem no consistent estimators may exist at all Additional information is desirable This information can be of various types One type is exact prior knowledge about functions of the parameters This leads to the CALS estimator Another major type is in the form of instrumental variables Many aspects of this are discussed including heteroskedasticity combination of data

from different sources construction of instruments from the available data and the LIML estimator which is especially relevant when the instruments are weak The scope is then widened to an embedding of the regression equation with measurement error in a multiple equations setting leading to the exploratory factor analysis EFA model This marks the step from measurement error to latent variables Estimation of the EFA model leads to an eigenvalue problem A variety of models is reviewed that involve eigenvalue problems as their common characteristic EFA is extended to confirmatory factor analysis CFA by including restrictions on the parameters of the factor analysis model and next by relating the factors to background variables These models are all structural equation models SEMs a very general and important class of models with the LISREL model as its best known representation encompassing almost all linear equation systems with latent variables Estimation of SEMs can be viewed as an application of the generalized method of moments GMM GMM in general and for SEM in particular is discussed at great length including the generality of GMM optimal weighting conditional moments continuous updating simulation estimation the link with the method of maximum likelihood and in particular testing and model evaluation for GMM The discussion concludes with nonlinear models The emphasis is on polynomial models and models that are nonlinear due to a filter on the dependent variables like discrete choice models or models with ordered categorical variables

Maddala,Calyampudi Radhakrishna Rao,1996-12-11 A comprehensive reference work for teaching at graduate level and research in empirical finance The chapters cover a wide range of statistical and probabilistic methods applied to a variety of financial methods and are written by internationally renowned experts

Introductory Econometrics with Applications Ramu Ramanathan,1995 Offers an ideal combination of econometric theory and hands on practical training for undergraduate and graduate courses The authors ambition is to provide realistic applications without sacrificing theoretical underpinnings He uses a logical step by step approach to walk readers through numerous real world examples of model specification estimation and hypothesis testing The book also succeeds at being self contained By including background information on mathematics probability statistics and software applications readers have all the information they need in one place
