Binary Decision Diagrams and Extensions for System Reliability Analysis Liudong Xing, Suprasad V. Amari, 2015-06-05 Recent advances in science and technology have made modern computing and engineering systems more powerful and sophisticated than ever. The increasing complexity and scale imply that system reliability problems not only continue to be a challenge but also require more efficient models and solutions. This is the first book systematically covering the state of the art binary decision diagrams and their extended models which can provide efficient and exact solutions to reliability analysis of large and complex systems. The book provides both basic concepts and detailed algorithms for modelling and evaluating reliability of a wide range of complex systems such as multi state systems, phased mission systems, fault tolerant systems with imperfect fault coverage, systems with common cause failures, systems with disjoint failures, and systems with functional dependent failures. These types of systems abound in safety critical or mission critical applications such as aerospace circuits, power systems, medical systems, telecommunication systems, transmission systems, traffic light systems, data storage systems, and etc. The book provides both small scale illustrative examples and large scale benchmark examples to demonstrate broad applications and advantages of different decision diagrams based methods for complex system reliability analysis. Other measures including component importance and failure frequency are also covered. A rich set of references is cited in the book providing helpful resources for readers to pursue further research and study of the topics. The target audience of the book is reliability and safety engineers or researchers. The book can serve as a textbook on system reliability analysis. It can also serve as a tutorial and reference book on decision diagrams, multi state systems, phased mission systems, and imperfect fault coverage models.

Missile Guidance and Control Systems George M. This book offers a comprehensive and up to date account of the technology behind tactical and strategic missiles and the guidance control and instrumentation required to reach a given target. Topics covered include missile aerodynamic forces and moments, the missile mathematical model, weapon delivery, GPS, Global Positioning System, and TERCOM terrain contour matching guidance, cruise missile mechanization equations, and a detailed analysis of ballistic

missile guidance laws The presentation assumes familiarity with calculus ordinary differential equations and some knowledge of modern control theory The text is replete with practical examples designed to illustrate important concepts This book will be an essential resource for students of aeronautical aerospace engineering as well as practicing engineers involved in the design development and analysis of modern aerospace guidance and control systems **Geodynamics of the Indian Plate**
