**Analysis and Synthesis of Distributed Real-Time Embedded Systems** Paul Pop, Petru Eles, Zebo Peng, 2013-03-19 Embedded computer systems are now everywhere from alarm clocks to PDAs from mobile phones to cars almost all the devices we use are controlled by embedded computers An important class of embedded computer systems is that of hard real time systems which have to fulfill strict timing requirements As real time systems become more complex they are often implemented using distributed heterogeneous architectures Analysis and Synthesis of Distributed Real Time Embedded Systems addresses the design of real time applications implemented using distributed heterogeneous architectures The systems are heterogeneous not only in terms of hardware components but also in terms of communication protocols and scheduling policies Regarding this last aspect time driven and event driven systems as well as a combination of the two are considered Such systems are used in many application areas like automotive electronics real time multimedia avionics medical equipment and factory systems The proposed analysis and synthesis techniques derive optimized implementations that fulfill the imposed design constraints An important part of the implementation process is the synthesis of the communication infrastructure which has a significant impact on the overall system performance and cost Analysis and Synthesis of Distributed Real Time Embedded Systems considers the mapping and scheduling tasks within an incremental design process To reduce the time to market of products the design of real time systems seldom starts from scratch Typically designers start from an already existing system running certain applications and the design problem is to implement new functionality on top of this system Supporting such an incremental design process provides a high degree of flexibility and can result in important reductions of design costs

**STRONG Analysis and Synthesis of Distributed Real Time Embedded Systems** will be of interest to advanced undergraduates graduate students researchers and designers involved in the field of embedded systems

**ECRTS 2003**, 2003 Annotation The typical subjects treated in the conference are traditionally related to scheduling communication operating systems design methods computer architectures networks performance analysis and many more During the last few years the field of real time systems quickly expanded toward new application areas including multimedia computing embedded systems and wireless networks Such new domains gave rise to new challenges and stimulated research in novel directions such as quality of service management energy aware computing stochastic scheduling and feedback based techniques for adaptive operating systems

Proceedings of ASP-DAC/VLSI Design 2002, 2002 Papers from a January 2002 conference are organized into four sessions each on low power design synthesis testing layout and interconnects and technology as well as two sessions each on embedded systems verification and VLSI architecture one session on analog design and one session on hot c *Proceedings*
