Cabral,Rangaraj M. Rangayyan,2022-06-01 Fractal analysis is useful in digital image processing for the characterization of shape roughness and gray scale texture or complexity Breast masses present shape and gray scale characteristics in mammograms that vary between benign masses and malignant tumors This book demonstrates the use of fractal analysis to classify breast masses as benign masses or malignant tumors based on the irregularity exhibited in their contours and the gray scale variability exhibited in their mammographic images A few different approaches are described to estimate the fractal dimension FD of the contour of a mass including the ruler method box counting method and the power spectral analysis PSA method Procedures are also described for the estimation of the FD of the gray scale image of a mass using the blanket method and the PSA method To facilitate comparative analysis of FD as a feature for pattern classification of breast masses several other shape features and texture measures are described in the book The shape features described include compactness spiculation index fractional concavity and Fourier factor The texture measures described are statistical measures derived from the gray level cooccurrence matrix of the given image Texture measures reveal properties about the spatial distribution of the gray levels in the given image therefore the performance of texture measures may be dependent on

the resolution of the image For this reason an analysis of the effect of spatial resolution or pixel size on texture measures in the classification of breast masses is presented in the book The results demonstrated in the book indicate that fractal analysis is more suitable for characterization of the shape than the gray level variations of breast masses with area under the receiver operating characteristics of up to 0.93 with a dataset of 111 mammographic images of masses The methods and results presented in the book are useful for computer aided diagnosis of breast cancer Table of Contents Computer Aided Diagnosis of Breast Cancer Detection and Analysis of newline Breast Masses Datasets of Images of Breast Masses Methods for Fractal Analysis Pattern Classification Results of Classification of Breast Masses Concluding Remarks *Computer-Aided Detection of Architectural Distortion in Prior Mammograms of Interval Cancer* Shantanu Banik,Rangaraj Rangayyan,J.E. Leo Desautels,2022-05-31 Architectural distortion is an important and early sign of breast cancer but because of its subtlety it is a common cause of false negative findings on screening mammograms Screening mammograms obtained prior to the detection of cancer could contain subtle signs of early stages of breast cancer in particular architectural distortion This book presents image processing and pattern recognition techniques to detect architectural distortion in prior mammograms of interval cancer cases The methods are based upon Gabor filters phase portrait analysis procedures for the analysis of the angular spread of power fractal analysis Laws texture energy measures derived from geometrically transformed regions of interest ROIs and Haralick s texture features With Gabor filters and phase portrait analysis 4 224 ROIs were automatically obtained from 106 prior mammograms of 56 interval cancer cases including 301 true positive ROIs related to architectural distortion and from 52 mammograms of 13 normal cases For each ROI the fractal dimension the entropy of the angular spread of power 10 Laws texture energy measures and Haralick s 14 texture features were computed The areas under the receiver operating characteristic ROC curves obtained using the features selected by stepwise logistic regression and the leave one image out method are 0.77 with the Bayesian classifier 0.76 with Fisher linear discriminant analysis and 0.79 with a neural network classifier Free response ROC analysis indicated sensitivities of 0.80 and 0.90 at 5.7 and 8.8 false positives FPs per image respectively with the Bayesian classifier and the leave one image out method The present study has demonstrated the ability to detect early signs of breast cancer 15 months ahead of the time of clinical diagnosis on the average for interval cancer cases with a sensitivity of 0.8 at 5.7 FP image The presented computer aided detection techniques dedicated to accurate detection and localization of architectural distortion could lead to efficient detection of early and subtle signs of breast cancer at pre mass formation stages Table of Contents Introduction Detection of Early Signs of Breast Cancer Detection and Analysis of Oriented Patterns Detection of Potential Sites of Architectural Distortion Experimental Set Up and Datasets Feature Selection and Pattern Classification Analysis of Oriented Patterns Related to Architectural Distortion Detection of Architectural Distortion in Prior Mammograms Concluding Remarks **Computerized Maintenance Management Systems for Clinical Engineering** MS.
