Non Linear Variability In Geophysics Non Linear Variability In Geophysics:

Non-Linear Variability in Geophysics D. Schertzer, S. Lovejoy, 2012-12-06 consequences of broken symmetry here parity is studied In this model turbulence is dominated by a hierarchy of helical corkscrew structures The authors stress the unique features of such pseudo scalar cascades as well as the extreme nature of the resulting intermittent fluctuations Intermittent turbulent cascades was also the theme of a paper by us in which we show that universality classes exist for continuous cascades in which an infinite number of cascade steps occur over a finite range of scales This result is the multiplicative analogue of the familiar central limit theorem for the addition of random variables Finally an interesting paper by Pasmanter investigates the scaling associated with anomalous diffusion in a chaotic tidal basin model involving a small number of degrees of freedom Although the statistical literature is replete with techniques for dealing with those random processes characterized by both exponentially decaying non scaling autocorrelations and exponentially decaying probability distributions there is a real paucity of literature appropriate for geophysical fields exhibiting either scaling over wide ranges e g algebraic autocorrelations or extreme fluctuations e g algebraic probabilities divergence of high order statistical moments In fact about the only relevant technique that is regularly used Fourier analysis energy spectra permits only an estimate of a single power law exponent If the fields were mono fractal characterized by a single fractal dimension this would be sufficient however their generally multifractal character calls for the development of new techniques Multifractals and Turbulence D. understanding in the same sense as the Renormalization Group method has allowed to understand the critical properties of phase transitions

Geomathematics: Theoretical Foundations, Applications and Future Developments Frits Agterberg, 2014-07-14 This book provides a wealth of geomathematical case history studies performed by the author during his career at the Ministry of Natural Resources Canada Geological Survey of Canada NRCan GSC Several of the techniques newly developed by the author and colleagues that are described in this book have become widely adopted not only for further research by geomathematical colleagues but by government organizations and industry worldwide These include Weights of Evidence modelling mineral resource estimation technology trend surface analysis automatic stratigraphic correlation and nonlinear geochemical exploration methods The author has developed maximum likelihood methodology and spline fitting techniques for the construction of the international numerical geologic timescale He has introduced the application of new theory of fractals and multi fractals in the geostatistical evaluation of regional mineral resources and ore reserves and to study the spatial distribution of metals in rocks The book also contains sections deemed important by the author but that have not been widely adopted because they require further research These include the geometry of preferred orientations of contours and edge effects on maps time series analysis of Quaternary retreating ice sheet related sedimentary data estimation of first and last appearances of fossil taxa from frequency distributions of their observed first and last occurrences tectonic reactivation along pre existing schistosity planes in fold belts use of the grouped jackknife method for bias reduction in geometrical extrapolations and new applications of the theory of permanent volume independent frequency distributions
