**Iterative Learning Control** Yangquan Chen, Changyun Wen, 2007-10-03 This book provides readers with a comprehensive coverage of iterative learning control. The book can be used as a text or reference for a course at graduate level and is also suitable for self study and for industry oriented courses of continuing education. Ranging from aerodynamic curve identification robotics to functional neuromuscular stimulation. Iterative Learning Control (ILC) started in the early 80s is found to have wide applications in practice. Generally a system under control may have uncertainties in its dynamic model and its environment. One attractive point in ILC lies in the utilisation of the system repetitiveness to reduce such uncertainties and in turn to improve the control performance by operating the system repeatedly. This monograph emphasises both theoretical and practical aspects of ILC. It provides some recent developments in ILC convergence and robustness analysis. The book also considers issues in ILC design. Several practical applications are presented to illustrate the effectiveness of ILC. The applied examples provided in this monograph are particularly beneficial to readers who wish to capitalise the system repetitiveness to improve system control performance.

High-order Iterative Learning Control Yangquan Chen, 1997

*Iterative Learning Control* Hyo-Sung Ahn, Kevin L. Moore, Yangquan Chen, 2007-06-28 This monograph studies the design of robust monotonically convergent iterative learning controllers for discrete time systems. Iterative learning control (ILC) is well recognized as an efficient method that offers significant performance improvement for systems that operate in an iterative or repetitive fashion e.g. robot arms in manufacturing or batch processes in an industrial setting. Though the fundamentals of ILC design have been well addressed in the literature two key problems have been the subject of continuing search activity. First many ILC design strategies assume nominal knowledge of the system to be controlled. Only recently has a comprehensive approach to robust ILC analysis and design been established to handle the situation where the plant model is uncertain. Second it is well known that many

ILC algorithms do not produce monotonic convergence though in applications monotonic convergence can be essential. This monograph addresses these two key problems by providing a unified analysis and design framework for robust monotonically convergent ILC. The particular approach used throughout is to consider ILC design in the iteration domain rather than in the time domain. Using a lifting technique the two dimensional ILC system which has dynamics in both the time and iteration domains is transformed into a one dimensional system with dynamics only in the iteration domain. The so called super vector framework resulting from this transformation is used to analyze both robustness and monotonic convergence for typical uncertainty models including parametric interval certainties frequency like uncertainty in the iteration domain and iteration domain stochastic uncertainty.

**Iterative Learning Control** Zeungnam Bien, Jian-Xin Xu, 2012-12-06 Iterative Learning Control ILC differs from most existing control methods in the sense that it exploits every possibility to incorporate past control information such as tracking errors and control input signals into the construction of the present control action. There are two phases in Iterative Learning Control first the long term memory components are used to store past control information then the stored control information is fused in a certain manner so as to ensure that the system meets control specifications such as convergence robustness etc. It is worth pointing out that those control specifications may not be easily satisfied by other control methods as they require more prior knowledge of the process in the stage of the controller design. ILC requires much less information of the system variations to yield the desired dynamic behaviors. Due to its simplicity and effectiveness ILC has received considerable attention and applications in many areas for the past one and half decades. Most contributions have been focused on developing new ILC algorithms with property analysis. Since 1992 the research in ILC has progressed by leaps and bounds. On one hand substantial work has been conducted and reported in the core area of developing and analyzing new ILC algorithms. On the other hand researchers have realized that integration of ILC with other control techniques may give rise to better controllers that exhibit desired performance which is impossible by any individual approach.

**Robust and Fault-Tolerant Control** Krzysztof Patan, 2019-03-16 Robust and Fault Tolerant Control proposes novel automatic control strategies for nonlinear systems developed by means of artificial neural networks and pays special attention to robust and fault tolerant approaches. The book discusses robustness and fault tolerance in the context of model predictive control fault accommodation and reconfiguration and iterative learning control strategies. Expanding on its theoretical deliberations the monograph includes many case studies demonstrating how the proposed approaches work in practice. The most important features of the book include a comprehensive review of neural network architectures with possible applications in system modelling and control a concise introduction to robust and fault tolerant control step by step presentation of the control approaches proposed an abundance of case studies illustrating the important steps in designing robust and fault tolerant control and a large number of figures and tables facilitating the performance analysis of the control approaches described. The material presented in this book will be useful for researchers and engineers who wish to avoid

spending excessive time in searching neural network based control solutions It is written for electrical computer science and automatic control engineers interested in control theory and their applications This monograph will also interest postgraduate students engaged in self study of nonlinear robust and fault tolerant control
