

## Chapter 5 – Elasticity and Its Applications

Do they depend both on the numbers of firms producing?

- What is elasticity? What kinds of factors can increase, decrease, or stabilize it?
- What is the price elasticity of demand? How is it related to the demand curve? How is it related to demand's steepness?
- What is the price elasticity of supply? How is it related to the supply curve?
- What are the income and cross-price elasticities of demand?

Do they?

How does elasticity fit into consumer choice theory?

How does elasticity measure and maximize net consumer surplus?

How does elasticity help in understanding the opportunity cost of your time, as well as the benefits of saving your time to study?

How does elasticity help explain why you want to sell an item yesterday if you have your price, how many have accepted? How much will your revenue fall, or might it even increase?

Eligible:

- Know how elasticity measures how much the variable responds to changes in another variable.
  - One type of elasticity measures how much demand for one variable will fall if another variable
- Definition:
  - Elasticity is a numerical measure of the responsiveness of  $Q^D$  or  $Q^S$  to a change in its determinants.

Price Elasticity of Demand

- Price elasticity of demand measures how much  $Q^D$  responds to a change in  $P$ .
- It measures the price sensitivity of buyers' demand.

$$\text{Price elasticity of demand} = \frac{\text{Percentage change in } Q^D}{\text{Percentage change in } P}$$

Along a demand curve,  $P$  and  $Q$  never increase together, which means that price elasticity is negative. We will look at this sign, and learn different methods to compute it.

Example:

The price elasticity of demand is 0.5. If the price of a good falls by 10%, how much will the quantity demanded change?

Calculating Percentage Change

Price falls from \$100 to \$90, which is (100-90)/100 = 10%

Quantity falls

by 5%, so (100-95)/100 = 5% (because 0.5)
