Movement compensation – When the body moves in a suboptimal way in response to kinetic chain dysfunction

Neural drive – The rate and volume of activation signals a muscle receives from the central nervous system.

Neuromuscular efficiency – The ability of the neuromuscular system to allow agonist, antagonists, synergists, and stabilizers to work synergistically to produce, reduce, and dynamically stabilize the Human Movement System in all three planes of motion

Overactive/shortened – Occurs when elevated neural drive causes a muscle to be held in a chronic state of contraction

Proprioception – The cumulative neural input from sensory afferents to the central nervous system

Reciprocal inhibition – When an agonist contracts, its functional antagonist relaxes to allow movement to occur at a joint.

Synergist – Muscles that assist prime movers during functional movement patterns

Stabilizer – Muscles that support or stabilize the body while the prime movers and the synergists perform the movement patterns

Underactive/lengthened – Occurs when inhibited neural drive allows a muscle's functional antagonist to pull it into a chronically elongated state
