

Transistor Characteristics

Aim:

To study the static characteristics of a Transistor (common emitter configuration)

Apparatus required:

NPN transistor, power supply, voltmeter, ammeter.

Theory:

A transistor is a solid state device used to amplify or switch electronic signals and electric power. A transistor consists of two pn junctions formed by sandwiching either P-type or N-type semiconductor between a pair of opposite types. There are two types of transistors, namely, N-P-N transistor and P-N-P transistor. The transistor can be regarded as a combination of two diodes connected back to back. There are three terminals taken from each type of semiconductor. The emitter, base and collector are provided with terminals which are labeled as E, B and C. The symbols employed for P-N-P and N-P-N transistor is as shown below. The arrow head is always at the emitter (not at the collector) and in each case, its direction indicates conventional direction of current flow. For a PNP transistor, the arrow head points emitter to base(emitter is positive with respect to base and also to the collector). And for a NPN transistor, arrow head points base to emitter(base is positive with respect to emitter and also with collector terminal)

1. **Emitter:** It forms left hand section of the transistor. It is more heavily doped than any other regions because its main function is to supply majority charge carriers, either electrons or holes.(electrons if emitter is N-type and holes if emitter is P-type)
2. **Base:** It forms the middle section of the transistor. It is very thin (of the order of 10^{-6}m) when compared with other sections, emitter and collector and is very lightly doped.
3. **Collector:** It forms the right hand section of the transistor and is lightly doped. Its main function as the name implies that to collect the majority charge carriers through base. The collector region is made physically larger when compared with other regions because it has to dissipate much greater power. And because of this reason, we cannot interchange the regions emitter to collector and vice versa. However, for the sake of convenience, it is customary to show emitter and collector to be of equal size.
