

Study Guide: Physical and Chemical Oceanography

Physical oceanographic processes controlled by:

- 1) Temperature - gives control by atmospheric heating and cooling which expands (hot) and contracts (cold) water, causing differences in density
- 2) Salinity - water moving through salt balance from evaporation/precipitation and ice melt and freezing respectively, leading to higher salinity waters and an overall increase in density
- 3) Geological characteristics - physical structure (continental shelves, trenches, ridges and seamounts, bathymetry) all have some to do with ocean circulation

Physical processes and properties in water:

- 1) Temperature - heat capacity, expansion/contraction
- 2) Salinity - expansion/contraction, freezing/melting, density

How temperature and salinity profiles form in the ocean and what they indicate:

Temperature differences across ocean layers:

- 1) atmospheric heating/cooling - Earth's surface is heated/cooled
- 2) evaporation/precipitation - evaporation is cooling, precipitation is heating
- 3) winds - the temperature difference brought on by winds is related to the Ekman layer

Salinity differences across ocean layers:

- 1) surface salinity is lower because of the thermal water expansion
- 2) water with higher salinity and lower density, float's on top of water with higher density
- 3) salinity is lower because of evaporation/precipitation differences
- 4) the salinity that remains is high density water that's sinking in the deep ocean

Waves:

How regular rise and fall of sea level is important to us that it's not in any other...

Gravitational effects:

on the Earth's ocean, mainly causing various ocean waves

Earth's gravitational pull: is the difference in height between the water surface...

Winds:

causes most surface water waves - surface winds pushing against them

Earth's rotation (Coriolis effect):

all particles in a rotating system have angular...
