fixed number of generally widely spaced supports. A symbolic representation of a transfer plate is shown in Fig. 2.3.4-1; Fig. 2.3.4-2 shows an example where a transfer plate was used to open a viaduct.

Figure 2.3.4-3 illustrates the application of a transfer plate in a building in Macao. The more than 80-story building is resting on a 3.5 m (11'-6") post-tensioned transfer plate with column drops that bring the total slab thickness to 3.5 m (18") at the supports. The computer model generated for the analysis and design of the slab shows the large number of walls

from the superstructure terminating on the transfer plate with only a few, widely spaced supports below (Fig. 2.3.4-4).

FIGURE 2.3.4-4 Computer Model of Service Apartments in Macao (Proprietary BS, AIA/PT, Gary, P16C)

To facilitate the construction of this transfer plate, which was located over 30 m (98 ft) above grade, two-layer construction was used. The bottom 1m (3' 3") thick layer was cast first and designed to carry the weight of the upper 2.5 m (8' 2") layer. The combined thickness was designed to resist the loads from the tower above. As indicated in Fig. 2.3.4-5, the post-tensioning tendons of both the lower and upper layers were installed before the lower layer was cast and stressed. Figure 2.3.4-6 shows a technician securing one of the ducts for the multi-strand tendons for the 3.5 m (11' 6") transfer plate.

2.3.5 Mat/Raft Foundations

When the allowable bearing pressure is not adequate to resist peak stresses below walls and columns, but the total area of the soil below the footprint of a structure is large enough to resist the total load, a mat/raft foundation can be a viable solution.

FIGURE 2.3.4-5 Transfer Plate Showing Both the 1 m Bottom Layer Tendons and the Full Height Tendons (P16C)

FIGURE 2.3.4-7 Construction View of a Transfer Plate 1.5 m (5-8) Thick (Courtesy Proprietary Gail, AIA/PT, Judd/Owner, K2L, P16C)

A mat foundation is a slab of nearly uniform thickness that often extends over the structure's entire footprint; its function is to distribute the loads, so that the soil pressure is reduced to allowable values. Figure 2.3.5-1 illustrates the point and the application of post-tensioning.

In conventionally reinforced concrete construction, when the mat/raft thickness is not adequate, the load from above does not distribute adequately over the entire mat surface. If the concentration of pressure below the loads exceeds the allowable bearing pressure (Fig. 2.3.5-2a), the mat thickness must be increased to achieve adequate distribution of the

The development of prestressing technology has constituted one of the more important improvements in the fields of structural engineering and construction Referring particularly to post tensioning applications it is generally recognized how it opens the possibility to improve economy structural behaviour and aesthetic aspects in concrete solutions In spite of the simplicity of its basic concepts and well known advantages the application extent of post tensioning solutions cannot be considered harmonized in the different areas and structural applications In fact for various reasons it appears that the potential offered by prestressing is far from being fully exploited especially in building structures field In many cases where post tensioning would provide a visibly superior solution it happens after all that a more conventional non prestressed solution is often selected The main objective of this fib Technical Report is therefore to show the benefits of using post tensioning for the more common practical applications in concrete buildings The document is mainly addressed to architects contractors and owners It is also drafted with the goal of motivating building designers to use post tensioning basic design aspects related to prestressing effects and design criteria are summarized and conceptual design aspects are emphasized A set of practical examples is presented showing the adopted solutions and their advantages when meeting the requirements of specific problems The selected examples were precisely not chosen because they are outstanding structures As a matter of fact post tensioning principles and technology can be used in any structure independently of its importance covering a wide range of building structural applications improving the structure quality and promoting concrete as a structural material The advantages of using post tensioning concerning structural behaviour economy detailing and constructive aspects are illustrated by the presentation of several existing structures most of them designed by Working Party members General design calculations are not presented but design results showing the improvement in structural behaviour are illustrated
